

PAC Chart

Q1

Given data

- N (Total guest)
- Season (Peak / off-Peak)
- Room (Standard, Deluxe, Suite)
- Nights (Nights stayed)

Required Results

- TPrice (Price per guest After Discount)
- Total (Total of all TPrices)

Processing Required

Solution Alternatives

- | | |
|---|---|
| <ul style="list-style-type: none"> • Initialize Total to 0 and Index to 1 • Use while loop with condition Index less than equals to N and take input season, Room, nights. • Find Rates PN (Rates Per Night) • To find Rates PN Use if Season is peak then for Standard = 5000, Deluxe = 8000 and Suite = 12000 if Season is off-peak then standard = 3000, Deluxe = 5000 and Suite = 8000 • Find TPrice By $TPrice = RatesPN * Nights$ • if $Nights > 7$ then 15% discount otherwise 20% | <ul style="list-style-type: none"> • Use for loop from 1 to N instead of while loop. • Store each TPrice in an array the after the for loop ends start another loop and output each TPrice and after the 2nd loop ends output Total. • Use nested IF-ELSE conditions to find RatesPN instead of different if's |
|---|---|

- then calculate Total
by $Total = Total + TPrice$
- Then output the TPrice.
- End the loop.
- OUTPUT the Total.
