

IPO

INPUT

- Vexpected
- UType.
- Ucat
- Permit
- Emergency.

Processing.

- Validate All inputs
- if Permit = 'N' and emergency = 'N'
Set reject status
- Set ~~spaces needed~~ Zone
Required. According to Ucat
and UType.
- Set spaces (2 for Vans &
1 for other (Bikes & Cars))
- check if vehicle can be.
Parked in target zone or not
 $CapX - OccX \geq Spaces$
- if this condition is
true then space available.
Assigne the Car to the Zone.
and increment Occupancy of
that zone by Spaces.
- ELSE increment Rejected
by 1
- Compare All 3 Zones
occupancy & and output
which is or which are the Highest

Output

- Allocation.
Message &
Remaining Capacity
- Rejection
Message with
Reason.
- Final Summary
- 1. Total Accepted
- 2. Total Parked
- 3. Total Rejected
- 4. ~~Total~~ ^{Count for} Cars,
Bikes & Vans
Parked.
- 5. All Zones
Occupancy &
Remaining Slots
- 6. Highest Zone

- 7. Campus Parking
Full or near.

• check if campus
Parking is full or not
by Adding All zones
occupancy & comparing
them to All 3 zones
Added capacity
 $CapA + CapB + CapC =$
 $OccA + OccB + OccC$
